1	<u>CLAIMS</u>
2	What is claimed is:
3	
4	1. A circuit comprising:
5	a differential amplifier having a differential input terminal pair and a differential output
6	terminal pair, wherein the differential amplifier provides a differential oscillating signal at the
7	differential output terminal pair; and
8	an inductor-capacitor (LC) tank coupled between the differential input and output
9	terminal pairs, wherein the LC tank comprises an inductive element coupled in parallel with a
10	capacitive element, wherein the capacitive element comprises:
11	a first varactor pair coupled to receive a first differential control voltage, the first
12	control voltage i) sets a capacitance of each varactor of the first varactor pair and ii)
13	provides a first level of adjustment to an oscillation frequency of the oscillating signal,
14	and
15	a second varactor pair coupled to receive a second differential control voltage, the
16	second control voltage i) sets a capacitance of each varactor of the second varactor pair
17	and ii) provides a second level of adjustment to the oscillation frequency of the oscillating
18	signal, wherein the first and second levels of adjustment are different.
1	2. The invention as recited in claim 1, wherein the capacitive element is AC-coupled
2	between the differential input and output terminal pairs.
1	3. The invention as recited in claim 1, wherein the differential amplifier comprises a
2	set of cross-coupled transistors.
1	4. The invention as recited in claim 3, wherein the set of cross-coupled transistors is
2	configured as a pair of back-to-back inverters.
1	5. The invention as recited in claim 1, wherein each of the first and second pairs of
2	varactors are configured as back-to-back varactors.
1	6. The invention as recited in claim 1, wherein the circuit is a voltage-controlled
2	oscillator (VCO).

- The invention as recited in claim 6, wherein the VCO is employed in a phase-locked loop (PLL) circuit, the first differential control voltage represents a feedback error for process variations of the PLL circuit, and the second differential control voltage represents a feedback phase error of the PLL circuit.
  - 8. The invention as recited in claim 1, further comprising at least one other pair of varactors, each of the at least one other pair of varactors coupled to receive a corresponding differential control voltage to i) set a capacitance of each varactor of the at least one other varactor pair and ii) provide a corresponding level of adjustment to the oscillation frequency of the oscillating signal.
  - 9. The invention as recited in claim 1, further comprising a filter, coupled between a source voltage and the differential output terminal pair of the differential amplifier, the filter adapted to filter one or more harmonics of the oscillation frequency.
- 1 10. The invention as recited in claim 1, wherein the circuit is embodied in an 2 integrated circuit.
